

Fractals

Part 3 : Mathematical background

Martin Samuelčík

Department of Applied Informatics

Space

- Space = set
- Is there relation between elements of this set ?
- Topology = how
- Geometry = where
- Relation = function of two arguments = metric

Metric space

- X – set (space)
- $d: X \times X \rightarrow \mathbb{R}$
- $d(x,y) = d(y,x)$ (*symmetry*)
- $d(x,y) \geq 0$
- $d(x,y) = 0 \iff x = y$
- $d(x,y) \leq d(x,z) + d(y,z)$
(*triangle inequality*)

Metric spaces

- (X, d) – metric space

- Open ball:

$$B(x, r) = \{y \text{ in } X : d(x, y) < r\}$$

- Circle:

$$C(x, r) = \{y \text{ in } X : d(x, y) = r\}$$

- $r = \text{radius}$

Metric spaces – examples

- Trivial: $d(x,y)=0$ if $x=y$ else 1
- (\mathbb{R},d) ; $d(x,y) = |x-y|$
- Euclidean space (\mathbb{R}^n,d)
- Manhattan (\mathbb{R}^2,d_1)
- Generalized (\mathbb{R}^n,d_p)
- Spherical space

$$d = \sqrt{\sum_{i=1}^n (x_i - y_i)^2}$$

$$d_p = \sqrt[p]{\sum_{i=1}^n (x_i - y_i)^p}$$

Generalized spaces

- Topological space
- Vector space – vector addition, scalar multiplication
- Hilbert space – vector space with inner product
- Banach space – vector space with norm
- Hausdorff space

Limits

- Convergent sequence x_n have limit s
- For $\varepsilon > 0$ exists $N > 0$ so that $d(x_n, x) < \varepsilon$, for each $n > N$
- Notation: $x = \lim_{n \rightarrow \infty} x_n$
- Cauchy sequence: For $\varepsilon > 0$ exists $N > 0$ so that $d(x_n, x_m) < \varepsilon$, for each $n, m > N$
- Cauchy = knowing conv. without limit

Complete & compact

- Complete space: if each Cauchy sequence has limit in space X
- Compact set: from any sequence of elements of S , a subsequence can always be extracted which tends to some limit element x of S
- Limit point: limit of any sequence
- Perfect set: $S =$ limit points
- Closed set: S consists all limit points

Complete & compact 2

- Compact \Leftrightarrow is bounded and closed
- Cantor set is perfect
- Set of rational numbers is not complete, compact
- Euclid space with euclidean metrics is complete

More metrics

- In complete metric spaces
- $d(x, A) = \inf\{d(x, y); y \text{ in } A\}$; A is set
- ? $d(A, B) = \sup\{d(x, B); x \text{ in } A\}$
- $d(A, B) \neq d(B, A)$ – not a metric
- Solution: Hausdorff metric
$$h(A, B) = \max\{d(A, B), d(B, A)\}$$

Hausdorff space

- X – complete metric space
- $H(X)$ – set of all non-empty compact subsets of X
- “Subset of set of all subsets”
- We need metric for compactness
- $(H(X), h)$ – Hausdorff space

Hausdorff space 2

- $h(A,B)$ is small for similar sets
- $A_\varepsilon = \{x \mid d(x,y) < \varepsilon \text{ for some } y \text{ in } A\}$ -
 ε - collar
- $h(A,B) = \inf\{ \varepsilon \mid A \text{ in } B_\varepsilon \ \& \ B \text{ in } A_\varepsilon\}$
- If A,B are two points $\Rightarrow h(A,B)=d(A,B)$
- Many fractals “live” in $(H(X),h)$

Hausdorff measure

- $\text{diam}(A) = \sup\{d(x,y); x,y \text{ in } U\}$

- open cover of A: $A \subset \bigcup_{i=1}^{\infty} U_i$

- s-dimensional Hausdorff measure:

$$h_{\varepsilon}^s(A) = \inf\left\{\sum_{i=1}^{\infty} \text{diam}(U_i)^s\right\}; \text{diam}(U_i) < \varepsilon$$

$$h^s(A) = \lim_{\varepsilon \rightarrow 0} h_{\varepsilon}^s(A)$$

- Can be used for length of curve, area of surface, ...

Hausdorff dimension

- For any set A there exist number $D(A)$
- For $s < D(A)$ is measure infinite
- For $s > D(A)$ is measure 0
- $D(A)$ – Hausdorff dimension
- $D(A)$ can be infinite, 0, any positive real number

Transformations

- In metric space X
- Transformation on X is function $f: X \rightarrow X$
- If S is subset of X , $f(S) = \{f(x) \mid x \text{ in } S\}$
- Forward iterations $x, f(x), f(f(x)), \dots, f^n(x), \dots$
- Orbit, Infinitely process
- We need to measure transformations

Transformations 2

- Affine: preserving collinearity and ratios of distances – scaling, translation, rotation, shearing
- Affine: $F(x)=Ax+b$
- Polynomial
- Linear fractional (Möbius)

Contraction transformation

- Contraction: $d(f(x), f(y)) \leq C d(x, y)$ for each x, y in X
- C in $(0, 1)$
- C depends on metric
- Contraction ($C < 1$), expansion ($C > 1$), symmetry ($C = 1$)
- Contraction is always continuous

Fixed point theorem

- Banach
- (X, d) complete metric space
- f – contraction
- There exists unique fixed point x_f :
 $f(x_f) = x_f$
- For each x in X sequence $\{f^n(x)\}$ converges to x_f

Fixed point theorem 2

- Simple proof
- Speed of conversion

$$d(x^*, x_n) \leq \frac{q^n}{1 - q} d(x_1, x_0).$$

- Base for many fractals
- Generalized for sets
- Other fixed point theorems

Transformations in HS

- $f(B) = \{f(x) : x \in B\}$, for $B \in H(X)$
- If f is contraction in X , then f is in $H(X)$
- Contractions $\{f_1, f_2, \dots, f_N\}$ with factors $\{s_1, s_2, \dots, s_N\}$.
- $W: H(X) \rightarrow H(X) \quad W(B) = \bigcup_{n=1}^N f_n(B) \quad \forall B \in H(X)$
- W is contraction with factor $s = \max \{s_1, s_2, \dots, s_N\}$

End

End of Part 3
