Fractals

Part 8 : Stochastic fractals

Why randomness ?

- Generalized set of shapes
- More nature-like
- Not strict self-similarity
- Often using Brownian motion
- For each type of fractal
- Using randomness in any stage

Sierpinski

Percolation

- Given triangular or square lattice
- Given probability p
- Color each sub cell with probability
- Check number of disjunctive parts
- Many -> one clusters = percolation
- p_c percolation threshold

Percolation 2

Forest fire simulation

- Square lattice
- Trees with probability p
- For p>p_c whole forest will burn
- For p<p_c only part of forest will burn
- For p=p_c the forest will burn for longest time
- p_c ~ 0.5928

Forest fire simulation 2

Renormalization

- For triangular lattice
- Sites -> super-sites
- Super-site is occupied if two or three sites are occupied

Renormalization 2

- With p'>p we fill gasps
- With p'
- p'=p we expect similarity
- p'=p³+3p²(1-p)
- p=p_c=0.5
- Statistical self-similarity

Renormalization 3

Particles aggregation

- Laboratory experiment
- Zinc-metal leaves

DLA

- Particle is moving with Brownian motion
- If free particle approaches to sticky particle, it stops and becomes sticky
- Repeating with another particle
- Simulation using pixels
- Diffusion Limited Aggregation

Problems

- What is the fractal dimension?
- Density of particles decreases from center. Is there power law for it?
- Is voltage with relation to fractal dimension?
- Is size of aggregate with relation to fractal dimension?

Still not precise solutions

■ D~1.7

Iocal.wasp.uwa.edu.au/~pbourke/fractals/dla3d/

3D DLA

Using DLA & percolation

- Distribution of galaxies
- Microcosm
- Porous media
- Clouds, rainfall areas
- Simulation of growth
- Crystals

Brownian motion

- "Chaotic" movement of particles
- Related to Gaussian distribution
- Statistically self-similar fractal
- Base for other statistical fractals

Gaussian distribution

Probability density function

$$f(x;\mu,\sigma^2) = \frac{1}{\sigma\sqrt{2\pi}}e^{-\frac{(x-\mu)^2}{2\sigma^2}}$$

 $\mu = 0$, $\sigma^2 = 0.2$. $\sigma^2 = 1.0, -$

 $\mu = -2, \sigma^2 = 0.5, \sigma$

 $\sigma^2 = 5.0$

4

 $\mu = 0.$

 $\mu = 0$

0.8

 $\Phi_{\mu,\sigma^{2}}(x)$

0.2

0.0

-5

-4

Cumulative distribution function

$$\Phi(x) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{x} e^{-t^2/2} dt = \frac{1}{2} \left[1 + \operatorname{erf}\left(\frac{x}{\sqrt{2}}\right) \right], \quad x \in \mathbb{R}.$$
$$F(x; \, \mu, \sigma^2) = \Phi\left(\frac{x-\mu}{\sigma}\right) = \frac{1}{2} \left[1 + \operatorname{erf}\left(\frac{x-\mu}{\sigma\sqrt{2}}\right) \right], \quad x \in \mathbb{R}.$$

Simulation of BM

- 1D simulation Wiener process
 - $W_0 = 0$, $W_t W_s \sim N(0, t-s)$

Proceeding in t with uniform steps

- $X(0)=0, X(k)=D_1+...+D_k; k=1,2,3,...$
- Using Gaussian random numbers (expected value 0, variance 1) as displacement D_k
- Scaling:
 - V_t=1/sqrt(c)W_{ct} is another Wiener process
 - in x 2 times, in y sqrt(2) times
 - X(t+dt)-X(t) and 1/r^{0.5}(X(t+r.dt)-X(t)) are statistically equivalent
- $X(t+dt) = X(t) + v \cdot dt^{0.5} \cdot N(0,1)$
 - v speed of particle

- Construction of parabola P(x) = a bx²,
 b > 0
- Archimedes

Landsberg curve

- In each stage for each line displace midpoint in y-direction with Gaussian random number multiplied by scale
- X(0)=0; X(1)=GRN
- $X(1/2) = (1/2) * (X(0) + X(1)) + D_1 / sqrt(2)$
- Recursive algorithm

Hurst exponent

- Creating Fractal Brownian Motion (FBm)
- Can be generalized with parameter H
- In i-th step, multiply Gaussian random number by 2^{-Hi}
- H Hurst exponent, 0<H<1</p>
- Curves dimension D = 2-H
- Surfaces dimension D = 3-H

Exponents and dimensions

Midpoint displacement ext.

- Modeling natural objects
- Coastline = initial closed polygon,
- Landscape = extension to 2D, dividing triangles or squares
- Fake clouds = colored height map
- True clouds = map of points above threshold

Coastline

Better method – subdividing squareDiamond-square algorithm

old points
new points

Improvements

- Merging of different terrains with several Hurst exponents
- Adding fractal noise to smooth terrain
- Spectral Synthesis Method remove high frequencies using Fourier transform

Visualization

- Mostly visualization of height map
- Coloring: Mapping aerial textures, using height for color
- Acceleration structures quadtrees
- HW support tesselation, vertex shaders displacement mapping
- Raytracing subdivided are only parts of terrain that are hit by some ray

Professional landscape

Generating clouds

- 2D clouds = height map
- Draw the height field as color map with different transparency based on height

End of Part 8
